                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           nue present invention provides the protein and coding sequence for the human tankyrase2 protein. This is found in two different versions, designated TANK2-LONG and TANK2-SHORT. Tankyrase2 has modification of polyADP-ribosylation activity and is involved in the modification of TRPI, which is a telemere-specific binding protein. The regulation of telomene length, in which TRFI has a role, is linked to ageing and cancer. The sequences are useful in the treatment of cancers and inflammatory disorders.

The present sequence represents a novel candidate effector for the Grb7 family of signalling proteins, termed 2.2412. The the Grb7 family of signalling proteins, termed 2.2412. The captence is predicted from a partial cDNA (see AAX25366). 2.2412 captured is predicted from a partial cDNA (see AAX25366). 2.2412 cmRNA transcripts (7 kb) were detected in all tissues examined containing a larger a muscle and placenta. Analysis of the sequence revealed skeletal muscle and placenta. Analysis of the sequence revealed significant homology to a large number of proteins containing conformation of the 2.2412 gene was localised to between chromosome 10q23.2 and proximal 10q23.32. Deletions in the chromosome 10q23.2 and proximal 10q23.32. Deletions in the chromosome logis. The 2.2412 gene was locationed the protein multiforme, melanoma and meningiomas. Detection of the protein multiforme, melanoma and meningiomas. Detection of the protein cancer and/or prognestic indicator for certain human cancers, in particular breast cancer and prostate cancer. Antagonism of the interaction between Grb7 family members and the canced protein should provide a novel treatment stategy for human diseases exhibiting aberrant receptor tyrosine kinase signalling, catch as cancer. Antiform a nibodies can be used in methods of cetecting the presence of 2.2412 protein in a sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           208

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence is the Tankyrase homologue isotype I (TaHo-1) protein of the invention. The invention also relates to the TaHo-2 protein. The TaHo proteins are useful for inducing or preventing cell proliferation in cells, and in the study or treatment of conditions mediated by the cell cycle proteins, such as to diagnose, treat or prevent cell cycle associated disorders, preferably cancer. The TaHo coding sequences are useful as hybridisation probes, in chromosome and gene mapping and in the generation of anti-sense DNA and RNA. The coding sequences are also useful for the preparation of TaHo, for generating either transgenic animals or knock out animals which, in turn, are useful in a development and screening of therapeutically useful agents, in gene threapy, as vaccine, and for construction of hybridisation probes for mapping the gene which encodes TaHo and for the genetic analysis of individuals with genetic disorders. The TaHO proteins, and their coding
                                                                                                                                                                                                                                                                                                                                                                                                                                                    Tankyrase homologue isotype 1; TaHO-1; TaHO-2; cell proliferation; cell cycle protein; cell cycle associated disorder; cancer; gene mapping; chromosome mapping; gene therapy; vaccine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel recombinant cell cycle polypeptide, tankyrase H useful for inducing or preventing cell proliferation in cells, and for diagnosing, treating or preventing cell cycle associated disorders such as cancer

13;
                 The present sequence is a version of the human tankyrase II protein sequence. The protein is thought to be involved in signal transduction in the cell, and to have binding activity for other telomere-associated proteins. It is possible that it plays a role in the regulation of telomere length, thus affecting the replicative ability of the cell. The protein is useful for ribosylating target proteins, for determining tankyrase II binding activity in a sample, and for modulating telomere length in a cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                             697 yliqhgadvnaqdkggliplhnaasyghvdvaallikynacvnatdkwaftpiheaaqkg 756

This is found in two different versions, designated TANK2-ENORG and TANK2-SHORT. Tankyrase2 has polyADP-ribosylation activity and is involved in the modification of TRF1, which is a telomere-specific binding protein. The regulation of telomere length, in which TRF1 has a role, is linked to ageing and cancer. The sequences are useful in the treatment of cancers and inflammatory disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ----- 304

## SUMMARIES

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Meann. Genome 3:281-285(1992).

-!- FUNCTION: ATTACH INTEGRAL MEMBRANE PROTEINS TO CYTOSKELETAL

-!- FUNCTION: ATTACH INTEGRAL MEMBRANE PROTEIN BAND 4.2, TO

BLEMENTS; BIND TO THE ENYTHROCYTE MEMBRANE PROTEIN BAND 4.2, TO

NA-K ATPASE; TO THE LYMPHOCYTE MEMBRANE PROTEIN GP85, AND TO THE

CYTOSKELETAL PROTEINS FODELN, VIBENTIN AND DESMIN.

ERYTHROCYTE ANKYRINS ALSO LINK SPECTRIN (BETA CHAIN) TO THE

CYTOPLASMIC DOMARIN OF THE ENYTHROCYTES ANION EXCHANGE PROTEIN;

THEY RETAIN MOST OR ALL OF THESE BINDING FUNCTIONS.

-!- SUBCELLULAR LOCATION: CYTOPLASMIC SURPACE OF ERYTHROCYTIC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 PROSITE; PS50088; ANK_REPEAT; 20.

-1- FUNCTION: INHIBITOR OF NF-KAPPA-B THAT TIGHTLY REGULATES NF-KAPPA-B ACTIVATION BY COMPLEXING AND TRAPPING IT IN THE CYTOPLASM. MAY BE INVOLVED IN REGULATION OF TRANSCRIPTIONAL RESPONSES TO NF-KAPPA-B, INCLUDING CELL ADHESION, IMMUNE AND PROINFLAMMATORY RESPONSES, APOPTOSIS, DIFFERENTIATION AND GROWTH. CONTROLLED BY SEQUENTIAL SERINE-PHOSPHORYLATION, UBIODITINATION AND DEGRADATION. TYROSING-PHOSPHORYLATION COULD ONLY LEAD TO DISSOCIATION FROM NF-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gallus gallus (Chicken).

ACTIVE WHEN BOUND TO 2-56 (5'-PHOSPHORYLATED 2',5'-LINKED OLIGOADENTAPES). CAPABLE OF CLEAVING POLY(RU) AND, TO A LESSER EXTENT, POLY(RA), TO SETS OF DISCRETE PRODUCTS RANGING PROM BETWHERN 4 AND 22 NUCLEOTIDES IN LENGTH.

CATALYTIC ACTIVITY: CLEAVES 3' OF UNP DIMERS, WITH PREFERENCE FOR UN AND UN AND UN SEQUENCES.

-!- FUNCTION: SEX-DETERMINING PROTEIN. IT IS ESSENTIAL FOR THE
ADOPTION OF THE MALE SEXUAL FATE IN ALL TISSUES IN C.ELEGANS.
-!- SUBCELLULAR LOCATION: CYTOPLASMIC (POTENTIAL).
-!- SIMILARITY: CONTAINS 7 ANK REPEATS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Developmental protein; Phosphorylation; ANK repeat; Repeat. -!- ALTERNATIVE PRODUCTS: THE BETA-1 AND BETA-2 SUBUNITS ARE PRODUCED BY ALTERNATIVE SPLICING OF THE SAME GENE AND ONLY DIFFER IN THEIR C-TERNAINAL EXTREMITY.
-!- SIMILARITY: CONTAINS 5 ANK REPEATS.

ALTERNATIVE PRODUCTS: THE BETA-1 AND BETA-2 SUBUNITS ARE
PRODUCED BY ALTERNATIVE SPLICING OF THE SAME GENE AND ONLY
DIFFER IN THEIR C-TERMINAL EXTREMITY.
SIMILARITY: CONTAINS 5 ANK REPEATS.

Patent No. 5972678
Patent No. 5972678
GENERAL INFORMATION:
APPLICANT: Bilverman, Robert H.
APPLICANT: Hassel, Bret A.
APPLICANT: Anou, Animin
TITLE OF INVENTION: Animal 2-5A- Dependent RNases and
TITLE OF INVENTION: Encoding Sequence Therefor
Patent No. 5972678
NUMBER OF SEQUENCES: 5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    OPERATING SYSTEM: PC-DOS/MS-DOS
